READY MEALS

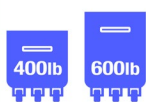

The EC20/30 (400 & 600lb) is a cabinet design washing machine which offers an exceptional wash performance to both internal and external surfaces of the standard 400 & 600 lb euro style buggies, also commonly known as Vmag carts or tote bins.

With its automatic motorized load and unload mechanism and our innovative travel jet system, the EC20-30 provides an efficient way of ensuring the internal and external surface of the euro buggy is cleaned.

OPERATIONAL DESIGN

The Euro buggys are loaded into the cradle and then are automatically inverted upside down inside the machine.

The internal surfaces are cleaned using a high impact jet system and the external surfaces and wheels are cleaned using our innovative Travel-jet system which oscillates forwards and backwards within the inside of the wash chamber with hot water and chemical that is re-circulated from the main wash tank.

Various wash programs allow the euro style dump buggys with varying degrees of contamination to be washed in a common unit. Filtration can be achieved by our standard removable screens, or an automatic filtration system can be employed as an option.

AUTOMATIC CHEMICAL DOSING SYSTEM

The EC20/30 is fitted with an automatic chemical dosing system which can be set up to work from a conductivity probe housed in the wash tank, or alternatively it can be set up on a timed dose basis. Our machines are designed to be used with caustic chemicals as standard.

RINSE CYCLE

The EC20/30 is supplied with a two-stage rinse, the first being a hot water rinse at 185°F and then the second being a cold-water rinse mixed with a chemical sanitizer additive.

The machine can be selected to run either rinse cycle after the wash cycle has been completed, or it can run the hot water rinse primarily followed by the cold-water sanitizer rinse.

SANITARY DESIGN

As with all our machines the EC20 Euro buggy washer is built using all the hygienic principles applied to all our equipment thus eliminating potential bacteria and pathogen breeding traps.
